Proposed definitions

We propose to exclude following definition from the list:

Fossil-based plastics.

We propose to add some new definition and some other should read as follows.

1. **Full-life-cycle approach.** Considering all potential impacts of all activities and outcomes associated with the plastics pollution, originated from plastic products, their design, packaging, distribution, use and reuse, maintenance and end-of-life management, including segregation, collection, sorting, recycling and disposal.

2. **Plastic(s).** Complex material based on macromolecular compounds (synthetic or natural polymers of all three main types - thermoplastics, or plastic polymers themself, elastomers and thermosets) with possible inclusion of different additives; these materials under the heating and/or pressure are able to be molded and retain a given shape after cooling or curing.

3. **Plastic product(s).** Any end-use product made of plastics.

4. **Waste management.** A complex process that includes the collection, accumulation, transportation, processing, disposal, decontamination, storage and landfill.

5. **Extended producer responsibility (EPR).** The obligation of producers and importers of goods and packaging of goods to ensure the disposal of waste generated as a result of loss of their consumer properties by produced and imported goods, including packaging of goods, in the amounts and under the conditions established by national legislation.
