We endorse option 1 and however, would like to emphasize the importance of establishing thorough guidelines and criteria. We advocate for the development of a comprehensive list of chemicals, chemical groups, and polymers that warrant elimination or phased-out. This list should be thoroughly identified using well-defined criteria that consider the toxicity nature, risk and hazard to health and environment and the application of these products. Our proposal is to engage in an intersessional process that ensures a robust evaluation of substances, aligning with proper criteria to guide the elimination or phased-out approach.
